Native cicadellids (Hemiptera: Cicadellidae) from Society Islands

Jérôme N. Petit¹, Julie Grandgirard¹ and Neil Davies¹

¹Richard B. Gump South Pacific Research Station, University of California, Berkeley, BP 244, 98728 Moorea, French Polynesia.

In collaboration with the Service of Rural Development of French Polynesia (Convention # 4.0328)
(Service du Développement Rural, BP 100, 98713 Papeete, Tahiti, French Polynesia)

In 2004, a classical biocontrol program against *Homalodisca vitripennis* Germar (Hemiptera: Cicadellidae) was conducting in French Polynesia, using the egg mymarid parasitoid *Gonatocerus ashmeadi* Girault (Hymenoptera: Mymaridae). An inventory of native cicadellids from French Polynesia has been achieved to assess the parasitoid potential risk of attack on non-targeted fauna. Approximately 24 species of cicadellids from 12 genera have been collected in Society Islands. None of those species belong to the host range of the parasitoid *G. ashmeadi*. Then, *G. ashmeadi* poses negligible risk to native cicadellids from Society Islands.
