THE IRREDUCIBILITIES OF APPELL'S F_4

Mitsuo KATO

1. Introduction.

In this paper we give a necessary and sufficient condition for the irreducibility of the system of Appell's differential equations of type F_4 .

Appell's system of hypergeometric differential equations of type F_4 is defined by

$$(F_4) \begin{cases} X(1-X)z_{XX} - Y^2z_{YY} - 2XYZ_{XY} + cz_X - (a+b+1)(Xz_X + Yz_Y) - abz = 0 \\ Y(1-Y)z_{YY} - X^2z_{XX} - 2XYZ_{XY} + c'z_Y - (a+b+1)(Xz_X + Yz_Y) - abz = 0 \end{cases}$$

which has four dimensional solution space \mathcal{F}_4 .

We say that (F_4) (or \mathcal{F}_4) is irreducible if there is no proper subspace of \mathcal{F}_4 which is invariant under operations of the monodromy group. Then irreducibility conditions are given by the following theorem.

THEOREM 1. (F_4) is irreducible if and only if none of $a, b, a-c, a-c', a-c-c', b-c, b-c', b-c-c'$ is an integer.

In [4], we have proved THEOREM 1 under the assumption

Received November 30, 1994.

that $c, c' \notin \mathbb{Z}$. This restriction arises from the fact that the fundamental solutions ω_i , $1 \leq i \leq 4$ adopted there are invalid when c or c' is an integer. But the "only if" part holds even if c or c' is an integer by continuity. We prove the "if" part of THEOREM 1 by choosing suitable fundamental solutions g_i , $1 \leq i \leq 4$.

2. Proof of THEOREM 1

In this section we prove the "if part" of THEOREM 1. So we assume that none of $a, b, a-c, b-c, a-c', b-c', a-c-c', b-c-c'$ is an integer.

In [4], we have proved that (F_4) is irreducible when $c, c' \notin \mathbb{Z}$. It is also true that if $c, a-b \notin \mathbb{Z}$ or if $c', a-b \notin \mathbb{Z}$ then (F_4) is irreducible by exchanging L_Y and L_∞ or L_X and L_∞ respectively.

So it suffices to prove for the case when two of $c, c', a-b$ are integers. We may assume for example that c and c' are integer.

Since (F_4) has the symmetries

$$(a, b, c, c') \longrightarrow (1+a-c, 1+b-c, 2-c, c'),$$

$$(a, b, c, c') \longrightarrow (1+a-c', 1+b-c', c, 2-c'),$$

$$(a, b, c, c') \longrightarrow (2+a-c-c', 2+b-c-c', 2-c, 2-c'),$$

we may assume that $c, c' \geq 1$. So we will prove the "if" part of THEOREM 1 under the condition that $c, c' \in \mathbb{N}$.

2.1 A system of Fundamental solutions for $c, c' \in \mathbb{N}$

We will find a basis of \mathcal{F}_4 in a neighborhood of $c=1+m$,

$$c' = 1+m', \quad m, m' \geq 0.$$

For $c, c' \in \mathbb{Z}$, put

$$f_1' = \Gamma(a)\Gamma(b)F_4(a, b, c, c'; X, Y),$$

$$f_2' = \Gamma(1+a-c)\Gamma(1+b-c)X^{1-c}F_4(1+a-c, 1+b-c, 2-c, c'; X, Y),$$

$$f_3' = \Gamma(1+a-c')\Gamma(1+b-c')Y^{1-c'}F_4(1+a-c', 1+b-c', c, 2-c'; X, Y),$$

$$f_4' = \Gamma(2+a-c-c')\Gamma(2+b-c-c')$$

$$X^{1-c}Y^{1-c'}F_4(2+a-c-c', 2+b-c-c', 2-c, 2-c'; X, Y).$$

Then

$$f_1'/\Gamma(c)\Gamma(c') = \sum \frac{\Gamma(a+k+k')\Gamma(b+k+k')}{\Gamma(c+k)\Gamma(c'+k')\Gamma(1+k)\Gamma(1+k')} X^k Y^{k'},$$

$$f_2'/\Gamma(2-c)\Gamma(c') = \sum \frac{\Gamma(1+a-c+k+k')\Gamma(1+b-c+k+k')}{\Gamma(2-c+k)\Gamma(c'+k')\Gamma(1+k)\Gamma(1+k')} X^{1-c+k} Y^{k'},$$

If $c \rightarrow 1+m$ ($m=0, 1, 2, \dots$) then

$$f_2'/\Gamma(2-c)\Gamma(c') \rightarrow f_1'/\Gamma(c)\Gamma(c'). \quad \text{Similarly}$$

$$f_4'/\Gamma(2-c)\Gamma(2-c') \rightarrow f_3'/\Gamma(c)\Gamma(2-c').$$

If $c' \rightarrow 1+m'$ ($m'=0, 1, 2, \dots$) then

$$f_3'/\Gamma(c)\Gamma(2-c') \rightarrow f_1'/\Gamma(c)\Gamma(c'),$$

$$f_4'/\Gamma(2-c)\Gamma(2-c') \rightarrow f_2'/\Gamma(2-c)\Gamma(c').$$

Hence

$$\Gamma(1-c)(f_2'/\Gamma(2-c)\Gamma(c') - f_1'/\Gamma(c)\Gamma(c')) \text{ and}$$

$\Gamma(1-c)(f_4^{\sim}/\Gamma(2-c)\Gamma(2-c^{\sim}) - f_3^{\sim}/\Gamma(c)\Gamma(2-c^{\sim}))$ are holomorphic at

$c=1+m$. Equivalently

$\Gamma(c-1)f_2^{\sim} + \Gamma(1-c)f_1^{\sim}$ and $\Gamma(c-1)f_4^{\sim} + \Gamma(1-c)f_3^{\sim}$ are

holomorphic at $c=1+m$.

By the same reason,

$\Gamma(c^{\sim}-1)f_3^{\sim} + \Gamma(1-c^{\sim})f_1^{\sim}$ and $\Gamma(c^{\sim}-1)f_4^{\sim} + \Gamma(1-c^{\sim})f_2^{\sim}$ are

holomorphic at $c^{\sim}=1+m^{\sim}$.

Thus we have the following four solutions of (F_4) in a neighborhood of $c=1+m, c^{\sim}=1+m^{\sim}$:

$$g_1 = f_1^{\sim},$$

$$g_2 = \Gamma(c-1)f_2^{\sim} + \Gamma(1-c)f_1^{\sim},$$

$$g_3 = \Gamma(c^{\sim}-1)f_3^{\sim} + \Gamma(1-c^{\sim})f_1^{\sim},$$

$$g_4 = \Gamma(c-1)\Gamma(c^{\sim}-1)f_4^{\sim} + \Gamma(1-c)\Gamma(c^{\sim}-1)f_3^{\sim} \\ + \Gamma(c-1)\Gamma(1-c^{\sim})f_2^{\sim} + \Gamma(1-c)\Gamma(1-c^{\sim})f_1^{\sim}.$$

Here g_4 is holomorphic at $c=1+m, c^{\sim}=1+m^{\sim}$ by Hartogs' theorem.

We will show that at $c=1+m, c^{\sim}=1+m^{\sim}$, g_i are of the following forms:

$$g_1 = \Gamma(a)\Gamma(b)F_4(a, b, 1+m, 1+m^{\sim}; X, Y),$$

$$g_2 = (-1)^{1+m} \log X g_1 / \Gamma(1+m) + X^{-m} g_{21},$$

$$g_3 = (-1)^{1+m^{\sim}} \log Y g_1 / \Gamma(1+m^{\sim}) + Y^{-m^{\sim}} g_{31},$$

$$g_4 = (-1)^{m+m^{\sim}} \log X \log Y g_1 / \Gamma(1+m)\Gamma(1+m^{\sim})$$

$$+ Y^{-m} \log X g_{41} + X^{-m} \log Y g_{42} + X^{-m} Y^{-m} g_{43},$$

where g_{ij} are holomorphic at $X=0, Y=0$. This proves that

g_1, g_2, g_3, g_4 form a system of fundamental solutions of (F_4) .

$$\text{Put } c=1+m-\delta, \quad c'=1+m'-\delta'.$$

$$g_2/\Gamma(c') = -\pi/\sin \pi c \{$$

$$\sum \frac{\Gamma(a+1-c+k+k')\Gamma(b+1-c+k+k')}{\Gamma(2-c+k)\Gamma(1+k)\Gamma(c'+k)\Gamma(1+k')} X^{1-c+k} Y^{k'}$$

$$- \sum \frac{\Gamma(a+k+k')\Gamma(b+k+k')}{\Gamma(c+k)\Gamma(1+k)\Gamma(c'+k)\Gamma(1+k')} X^k Y^{k'} \}$$

$$= (-1)^{1+m} \pi/\sin \pi \delta \{$$

$$X^{-m} \sum_{k < m} \frac{\Gamma(a-m+\delta+k+k')\Gamma(b-m+\delta+k+k')}{\Gamma(1-m+k+\delta)\Gamma(1+k)\Gamma(c'+k)\Gamma(1+k')} X^{k+\delta} Y^{k'}$$

$$+ \sum \left(\frac{\Gamma(a+k+k'+\delta)\Gamma(b+k+k'+\delta)}{\Gamma(1+k+\delta)\Gamma(1+m+k)\Gamma(c'+k)\Gamma(1+k')} X^\delta \right.$$

$$\left. - \frac{\Gamma(a+k+k')\Gamma(b+k+k')}{\Gamma(1+k)\Gamma(1+m+k-\delta)\Gamma(c'+k)\Gamma(1+k')} X^k Y^{k'} \right\}$$

If $\delta \rightarrow 0$ then

$$g_2/\Gamma(c') \rightarrow (-1)^{1+m} \{ \log X f_1' / \Gamma(c)\Gamma(c') \}$$

$$- X^{-m} \sum_{k < m} (-1)^{m-k} \frac{\Gamma(m-k)\Gamma(a-m+k+k')\Gamma(b-m+k+k')}{\Gamma(1+k)\Gamma(c'+k)\Gamma(1+k')} X^k Y^{k'}$$

$$+ \frac{\partial}{\partial \delta} \sum \frac{\Gamma(a+k+k'+\delta)\Gamma(b+k+k'+\delta)}{\Gamma(1+k+\delta)\Gamma(1+m+k+\delta)\Gamma(c'+k)\Gamma(1+k')} X^k Y^{k'} \Big|_{\delta=0}$$

Similarly if $\delta \rightarrow 0$ then

$$(\Gamma(c-1)f_4' + \Gamma(1-c)f_3')/\Gamma(2-c') \rightarrow (-1)^{1+m} \{ \log X f_3' / \Gamma(c)\Gamma(2-c') \}$$

$$- X^{-m} \sum_{k < m} (-1)^{m-k} \frac{\Gamma(m-k)\Gamma(1+a-c'-m+k+k')\Gamma(1+b-c'-m+k+k')}{\Gamma(1+k)\Gamma(2-c'+k)\Gamma(1+k')}$$

$$X^k Y^{1-c'+k'}$$

$$+ \frac{\partial}{\partial \delta} \sum \frac{\Gamma(1+a-c'+k+k'+\delta)\Gamma(1+b-c'+k+k'+\delta)}{\Gamma(1+k+\delta)\Gamma(1+m+k+\delta)\Gamma(2-c'+k)\Gamma(1+k')} X^k Y^{1-c'+k'} \Big|_{\delta=0}$$

If $\delta' \rightarrow 0$ then

$$g_3/\Gamma(c) \rightarrow (-1)^{1+m'} \{ \log Y f_1' / \Gamma(c)\Gamma(c') \}$$

$$- Y^{-m'} \sum_{k' < m'} (-1)^{m'-k'} \frac{\Gamma(m'-k')\Gamma(a-m'+k+k')\Gamma(b-m'+k+k')}{\Gamma(1+k)\Gamma(c+k)\Gamma(1+k')} X^k Y^{k'}$$

$$+ \frac{\partial}{\partial \delta'} \sum \frac{\Gamma(a+k+k'+\delta')\Gamma(b+k+k'+\delta')}{\Gamma(1+k)\Gamma(c+k)\Gamma(1+m'+k'+\delta')\Gamma(1+k'+\delta')} X^k Y^{k'} \Big|_{\delta'=0}$$

$$(\Gamma(c'-1)f_4'+\Gamma(1-c')f_2')/\Gamma(2-c) \rightarrow (-1)^{1+m'} \{ \log Y f_2' / \Gamma(2-c)\Gamma(c') \}$$

$$- Y^{-m'} \sum_{k' < m'} (-1)^{m'-k'}$$

$$\frac{\Gamma(m'-k')\Gamma(1+a-c-m'+k+k')\Gamma(1+b-c-m'+k+k')}{\Gamma(1+k)\Gamma(2-c+k)\Gamma(1+k')} X^k Y^{1-c'+k'}$$

$$+ \frac{\partial}{\partial \delta'} \sum \frac{\Gamma(1+a-c'+k+k'+\delta)\Gamma(1+b-c'+k+k'+\delta)}{\Gamma(1+k)\Gamma(2-c+k)\Gamma(1+m'+k'+\delta')\Gamma(1+k'+\delta')} X^k Y^{k'} \Big|_{\delta'=0}$$

Hence if $\delta \rightarrow 0$ and $\delta' \rightarrow 0$, then

$$g_4 \rightarrow (-1)^{m+m'} \{ \log X \log Y g_1 / \Gamma(1+m)\Gamma(1+m') \}$$

+ log X (

$$- Y^{-m'} \sum_{k' < m'} (-1)^{m'-k'} \frac{\Gamma(m'-k')\Gamma(a-m'+k+k')\Gamma(b-m'+k+k')}{\Gamma(1+k)\Gamma(1+m+k)\Gamma(1+k')} X^k Y^{k'}$$

$$+ \frac{\partial}{\partial \delta} \sum \frac{\Gamma(a+k+k'+\delta)\Gamma(b+k+k'+\delta)}{\Gamma(1+k)\Gamma(1+m+k)\Gamma(1+m'+k'+\delta')\Gamma(1+k'+\delta')} X^k Y^{k'} \Big|_{\delta'=0}$$

+ log Y (

$$- X^{-m} \sum_{k < m} (-1)^{m-k} \frac{\Gamma(m-k)\Gamma(a-m+k+k')\Gamma(b-m+k+k')}{\Gamma(1+k)\Gamma(1+m+k)\Gamma(1+k')} X^k Y^{k'}$$

$$+ \frac{\partial}{\partial \delta} \sum \frac{\Gamma(a+k+k'+\delta)\Gamma(b+k+k'+\delta)}{\Gamma(1+k+\delta)\Gamma(1+m+k+\delta)\Gamma(1+m'+k'+\delta')\Gamma(1+k'+\delta')} X^k Y^{k'} \Big|_{\delta'=0}$$

$$+ X^{-m} Y^{-m'} \sum_{k < m, k' < m'}$$

$$\begin{aligned}
& (-1)^{m+m'} \frac{\Gamma(m-k)\Gamma(m'-k')\Gamma(a-m-m'+k+k')\Gamma(b-m-m'+k+k')}{\Gamma(1+k)\Gamma(1+k')} X^k Y^{k'} \\
& - X^{-m} \frac{\partial}{\partial \delta} \sum_{k' < m'} (-1)^{m'-k'} \\
& \quad \frac{\Gamma(m'-k')\Gamma(a-m'+k+k'+\delta')\Gamma(b-m'+k+k'+\delta')}{\Gamma(1+k)\Gamma(1+k'+\delta')\Gamma(1+m'+k'+\delta')} X^k Y^{k'} \Big|_{\delta'=0} \\
& - Y^{-m'} \frac{\partial}{\partial \delta} \sum_{k < m} (-1)^{m-k} \\
& \quad \frac{\Gamma(m-k)\Gamma(a-m+k+k'+\delta)\Gamma(b-m+k+k'+\delta)}{\Gamma(1+k+\delta)\Gamma(1+m+k+\delta)\Gamma(1+k')} X^k Y^{k'} \Big|_{\delta=0} \\
& + \frac{\partial^2}{\partial \delta \partial \delta'} \sum \frac{\Gamma(a+k+k'+\delta+\delta')\Gamma(b+k+k'+\delta+\delta')}{\Gamma(1+k+\delta)\Gamma(1+m+k+\delta)\Gamma(1+m'+k'+\delta')\Gamma(1+k'+\delta')} X^k Y^{k'} \Big|_{\delta=0}^{\delta'=0}
\end{aligned}$$

Hence g_i are of the desired forms.

2.2 Proof of THEOREM 1

From now on we assume that c and c' are in a small neighborhoods of $1+m$ and $1+m'$ respectively.

In [4], we have considered a fundamental solutions $\omega_1, \omega_2, \omega_3, \omega_4$. Here

$$\begin{aligned}
g_1 &= \omega_1 / \Gamma(1-c)\Gamma(1-c'), \quad g_2 = \omega_2 / \Gamma(1-c'), \quad g_3 = \omega_3 / \Gamma(1-c), \\
g_4 &= \omega_2 + \omega_3 - \omega_4 \text{ for } c \neq 1+m, c' \neq 1+m'.
\end{aligned}$$

We recall here the fundamental group

$$\pi_1 = \pi_1(\mathbb{C}^2 - L_X \cup L_Y \cup C, P_0) \text{ where } L_X = \{X=0\}, L_Y = \{Y=0\},$$

$$C = \{(X-Y)^2 - 2(X+Y) + 1 = 0\}, P_0 = (1/100, 1/100). \text{ Let } \gamma_1 \text{ be the}$$

horizontal ($Y \equiv 1/100$) loop surrounding $L_X=0$ positively and γ_2

be the vertical loop surrounding $L_Y=0$. Let γ_3 be the diagonal

($X \equiv Y$) loop surrounding C positively.

The analytic continuation γ_i^g of $g = {}^t(g_1, g_2, g_3, g_4)$ along γ_i are then derived from $\gamma_i \omega$ (see [4]) as follows:

$$\gamma_1^g = \begin{pmatrix} 1 & 0 & 0 & 0 \\ (1-e(-c))\Gamma(1-c) & e(-c) & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & (1-e(-c))\Gamma(1-c) & e(-c) \end{pmatrix}^g,$$

$$\gamma_2^g = \begin{pmatrix} 1 & 0 & 0 & 0 \\ (1-e(-c'))\Gamma(1-c') & 1 & 0 & 0 \\ 0 & 0 & e(-c') & 0 \\ 0 & (1-e(-c'))\Gamma(1-c') & 0 & e(-c') \end{pmatrix}^g,$$

$$\gamma_3^g = \begin{pmatrix} -e(\mathcal{B}) & e_2 & e_3 & e_4 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}^g,$$

where $e(a) = \exp(2\pi\sqrt{-1} a)$, $\mathcal{B} = c + c' - a - b - 1$,

$$e_2 = e(\mathcal{B}/2) \pi \Gamma(c-1) \sin \pi(a+b-2c-c'),$$

$$e_3 = e(\mathcal{B}/2) \pi \Gamma(c'-1) \sin \pi(a+b-c-2c'),$$

$$e_4 = e(\mathcal{B}/2) \pi^2 \Gamma(c-1)\Gamma(c'-1) \sin \pi(a-c-c') \sin \pi(b-c-c').$$

Assume there exists a non trivial proper subspace W invariant under $\gamma_1, \gamma_2, \gamma_3$. W contains an eigen vector $\alpha g_1 + \beta g_3$ of γ_1 .

If $\beta = 0$, then $g_1 \in W$. If $\beta \neq 0$ then $\gamma_2(\alpha g_1 + \beta g_3) - (\alpha g_1 + \beta g_3) \in W$, which implies $g_1 \in W$. Hence we have

$$g_1 \in W.$$

$$\gamma_3(g_1) = -e(\mathcal{B})g_1 + e_2g_2 + e_3g_3 + e_4g_4 \in W, \quad e_4 \neq 0.$$

$$\gamma_1\gamma_3(g_1) - \gamma_3(g_3) = \beta_1g_1 + \beta_3g_3 \in W, \quad \beta_3 \neq 0. \quad \text{Since } g_1 \in W, \text{ we have}$$

$$g_3 \in W.$$

Similarly we have

$$g_2 \in W.$$

This contradicts to the fact that W is a proper subspace. And this proves theorem 1.4.

3. Reducible Cases.

As stated in [4], we know that

if one of $a, b, 1+a-c, 1+b-c, 1+a-c', 1+b-c', 2+a-c-c', 2+b-c-c'$ is a non positive (resp. positive) integer then \mathcal{F}_4 has a one dimensional (resp. three dimensional) invariant subspace of \mathcal{F}_4 under the operations of the monodromy group.

The three dimensional invariant spaces can be expressed by Appell's F_1 (see [4]).
